

Bulletin of the United States Fish Commission Volume 17

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1898 Excerpt: ...on the coast of the United States extends, as we have seen, over the months of July and August. If fishing in these months is closed the spawners are protected.¹ This can be done, and would result in some good, but at either end the spawning females would be subjected to fire. First, there being no way to detect females which are ready to spawn, these would be killed in great numbers up to the beginning of the period; then, after the close in September, if egg lobsters were captured and the eggs removed and destroyed, the good which has been done would be partially neutralized. Protection to the immature lobster by regulating the construction of traps, making the distance between the lower slats sufficiently great to let out all the lobsters except those of the legal size--10 inches--is a measure which, if generally carried out, could not fail to be beneficial. The canning industry is undoubtedly responsible for a large share in the depletion of this fishery. It is operated in the spring, and for years has destroyed large numbers of immature lobsters and of mature females nearly ready to spawn. The canneries have been allowed to use smaller lobsters than those which are sent to market, and we are told that if further restricted they could not exist. Whether this is true or not I do not know, but it is surely folly to protect an animal in one direction and allow it to be destroyed in another. We have now to speak of the artificial propagation of the lobster as a means of maintaining or increasing the supply. In 1893 I tried to point out some of the fundamental errors which rendered the

methods of artificial propagation abortive.
The objections whi...
