

## Contributions to embryology Volume 3

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1915 Excerpt: ...vegetatif ou il est entre: cest le copulation-path. Spermatozoide et aster se meuvent en longeant la surface de l'uf, vers lequateur. Dans ce mouvement, comme nous lavons vu plus haut, une grande partie du plasmе jaune est entraineе. Conklin signale chez Ciona la particularite suivante: Le spermatozoide est entoure dun protoplasme clair a structure alveolaire, quil emporte avec lui au centre du croissant. Conklin croit retrouver cette meme substance dans une calotte de protoplasme differencie quil observe de chaque cote de la ligne mediane, au pole posterieur de lembryon segmente en 8. Elle correspond a celle decrite par Castle sous le nom de clear protoplasm et passe finalement dans les small posterior mesenchyme cells (cellules B7.6 dans la nomenclature de Conklin), qui occupent le pole posterieur de la gastrula. Tandis que le pronucleus male est le siege de ces mouvements, le pronucleus femelle, contrairement a la description de Golski, ne reste pas immobile. Complettement depourvu dirradiations et entierement perdu dans le vitellus, il savance vers la zone claire occupee par le pronucleus male. Les deux pronuclei se rejoignent au niveau de lequateur de l'uf, a mi-distance entre le centre et le pole posterieur, le noyau femelle se trouvant invariablement place vers le centre. Auparavant deja, le centrosome male sest divise. Letude de Conklin que je viens de resumer portait sur les phenomenes chromatiques et achromatiques de la fecondation. Avec le travail de M...
