

## A tect-book of histology

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1901 Excerpt: ...washed with dilute alcohol until the parietal cells appear red and the chief cells bluish (Stintzing). Almost all acid anilin dyes have an affinity for the parietal cells; hence the red stains may be combined with hematoxylin and the blue ones with carmin. The chief cells then take the color of the carmin or hematoxylin, and the parietal cells that of the anilins. 243. An accurate fixation of that portion of the small intestine possessing villi is attended with great difficulty, since the axial tissue of the villi shows a tendency to retract from the epithelial layer surrounding it (the latter becoming fixed first); and as a consequence spaces are formed at the summits of the villi which undoubtedly represent artefacts. A good method is to cut pieces from tissue while still warm and fix in osmic acid. If portions of the intestine be filled with alcohol or corrosive sublimate and thus dilated, both the glands and villi are shortened. The methods above mentioned for staining mucin may be used to stain the goblet cells. The villi may also be examined in a fresh condition in one of the indifferent fluids (vid. T. 13). For this purpose the intestine of the mouse is especially well adapted. 244. The absorption of fat is best studied in preparations fixed in osmic acid, and especially in those treated by Altmanns method (vid. T. 124). 245. The technic for the solitary lymph-follicles and Peyers patches is the same as that for lymph-glands. For this purpose the cecum of a rabbit or guinea-pig is the best material. 246. The nerves of the intestinal mucous membrane are best demonstrated by means of the methylene-blue method or Golgis method (vid. Technic), and the coarser filaments of Auerbachsand

Meissners plexuses may also be stained by the gold method (Lowit...
