

## Lipoproteins in Health and Disease

This comprehensive work deals with the major health problem of high lipid levels in blood, a cause of serious heart and vascular disease. Formerly the province only of the chemical pathologist, cardiologists and general physicians are now offering treatment as new lipid-lowering drugs become available. The area is also of considerable interest to public health physicians as changes in lifestyle (such as dietary and smoking habits) have significant effects on lipid levels. A prestigious team of contributors covers all aspects of the topic, from molecular biology to practical dietary management to help reduce lipid levels.
