

# Risk Assessment of *Campylobacter* spp. in Broiler Chickens: Technical Report (Microbiological Risk Assessment Series)

*Campylobacter* is a leading cause of enteric infections in many countries. The principal reservoir of pathogenic *Campylobacter* spp. is the alimentary tract of wild and domesticated mammals and birds. Poultry meat is an important vehicle for foodborne transmission of *Campylobacter* spp., particularly *Campylobacter jejuni*.

FAO and WHO have undertaken a risk assessment of *Campylobacter* spp. in broiler chickens. This assessment compared the risk for a variety of scenarios and mitigation measures for control of the organism in a range of broiler chicken products. It also includes a review and analysis of current scientific information and a description of the risk model.

This volume and others in this Microbiological Risk Assessment Series contain information that is useful to both risk assessors and risk managers, the Codex Alimentarius Commission, governments and food regulatory agencies, industry and other people or institutions with an interest in *Campylobacter* spp. in broiler chickens, the public health impact and the use of risk assessment in the evaluation and selection of potential control strategies.
