

XARELTO (Rivaroxaban): Prevents Deep Venous Thrombosis (DVT) & Pulmonary Embolism, and Reduce Risk of Stroke & Systemic Embolism in Nonvalvular Atrial Fibrillation

## XARELTO (Rivaroxaban): Prevents Deep Venous Thrombosis (DVT) & Pulmonary Embolism, and Reduce Risk of Stroke & Systemic Embolism in Nonvalvular Atrial Fibrillation

Although, your health condition may impact your everyday life, do not let it define who you are. XARELTO (Rivaroxaban) is used to treat and prevent deep venous thrombosis, a condition in which harmful blood clots form in the blood vessels of the legs. These blood clots can travel to the lungs and can become lodged in the blood vessels of the lungs, causing a condition called pulmonary embolism. This medicine is used for several days after hip or knee replacement surgery while you are unable to walk. It is during this time that blood clots are most likely to form. XARELTO (Rivaroxaban) is also used to prevent stroke and blood clots in patients with certain heart rhythm problem (eg, nonvalvular atrial fibrillation). Thanks and may you have a good understanding about this drug XARELTO (Rivaroxaban). You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
